

CASE STUDY: **Creating Slip Resistant Steps**

Project: Provision Of Teeing Area Steps

Client: Warrington Golf Club

Procurement: By Invitation

Location: Cheshire

Date Undertaken: March, 2018

PROJECT OUTLINE:

Warrington Golf Club, along with many clubs across the UK, have experienced some difficulties with old timber steps and they wanted to try something new and innovative at their new elevated teeing area.

Due to the harsh British climate timber steps quickly become saturated and eventually rot and become uneven. Timber steps are also liable to algae build-up which makes them extremely slippery in wet conditions. Because timber retains moisture the steps are prone to freezing during winter.

These aspects present a danger to those who use them.

Due to the excellent porous, flexible and frost resistant properties of our nu-flex product, Nuphalt Contracting were asked to consider if we could construct steps using our material. Our team was obviously happy to oblige.

Nu-phalt Contracting provide an innovative solution to overcome issues with slippery and uneven timber steps. The result was a great outcome and a very happy client.

The Client:

'Once again Nu-phalt Contracting have not let us down and have delivered an excellent project. They are a great company to work with and try hard to always meet our expectations. Our members are delighted with the new steps and they are much safer than the old wooden steps.'

John McGloughlin, Course Manager

PROJECT OUTCOMES:

The project was a great success.

Officials and members at the club have been delighted with the outcome.

BENEFITS:

The asset manager and end-users alike have welcomed a number of benefits including;

- Well drained surface due to porosity of the material
- No algae formation
- Resistance to slipping due to the material's properties
- Significant reduction in the effects of ice and snow
- Excellent durability under foot
- Will not rot and become uneven
- Long design life
